## ABSTRACT OF THE DISCLOSURE

A schedule table is stored in a RAM of a schedule management apparatus and in a schedule storage section of a management center. The schedule management apparatus transmits a present position detected by a GPS to the management center continuously. The management center calculates a required time period to move from the present position of the schedule management apparatus to a place included in the schedule table and, when a time calculated from an expected start time of the schedule is reached, transmits an alarm to the schedule management apparatus. This alarm is displayed on a display section of the schedule management apparatus. By starting to move to the scheduled place, a user can arrive at the place before the expected start time even when the user starts from a place quite far from the scheduled place.
